

Project Title: Personal Portfolio Website:

Subject: Software Development – I

Your Name: SAZZAD HOSSAIN

Roll No: C243113

Semester: 3rd

Teacher Name: MD SADMAN HAFIZ

University Name: International Islamic University Chittagong

1 Abstract:

It is a personal portfolio website using HTML, CSS and Java Script. The aim of it is to ensure one's digital presence to the world. So it is a demo of a personal portfolio Website which highlights one's skills, educational background and personal information.

2 Introduction:

In the era of the internet, it is very necessary to maintain one's digital presence especially for students and professionals. Most companies and recruiters search candidates online, and a personal website helps to create a first personal impression.

A personal portfolio website is especially useful for students because it provides a platform to showcase technical skills, creativity, and real project work. It also helps students to organize their information in one place, such as education details, skills, and completed projects, which can be easily shared with teachers, interviewers, or clients.

The purpose of this project is to design and develop a responsive personal portfolio website using HTML, CSS, and JavaScript. The website is created to display personal information, technical skills, and project details in a structured and user-friendly manner. This project also helps in understanding basic web development concepts and improves practical knowledge of frontend technologies.

3 OBJECTIVES:

- To create personal branding
- To showcase skills and projects
- To provide contact information
- To practice web technologies

4 Target Users:

- Recruiters and hiring managers reviewing my profile.
- Those who are interested in my work.
- Friends and Family

5 Technology Used:

- HTML5: For structure
- CSS3: For styling and responsive
- Java script: For functionality
- Google sheet and App script: For data storing

6 Key Features:

- Fixed Navigation bar which has blur effect using a back-drop filter.
- The Hero Section with Introduction displays name, title and call to action button.
- Responsive Layout Using Grid
- Project Showcase Section
- Skills Display Section
- Education & Certification Sections
- About Me Section
- Contact Form where after submitting data, stores in Google sheet
- Social Media Icons
- Modern Dark Theme UI

7 Deployment Platform:

- Hosted in Github page

8 System Design:

Architecture Diagram:

Case Diagram:

Actor:

- Visitor (any user who opens the portfolio website)

Use Cases:

The visitor can perform the following actions on the website:

9 Folder Structure:

10 UI design:

Design Principle Used:

The portfolio website follows important UI design principles to improve user experience. Consistency is maintained by using similar card styles, colors, and layouts across all sections such as Projects, Skills, and Education. CSS Grid is used to properly align content and make the website responsive on different screen sizes. Visual hierarchy is created by using large headings and highlighted hero text to attract user attention. High contrast between dark background and light text improves readability. Hover effects are added to provide visual feedback when users interact with buttons and cards, making the website more interactive and user-friendly.

Projects:

Projects

Proshroom, an AI-Integrated website for Future Food

Shape the Future Challenge by Moonshot Pirates Research, Prototype, and a fully functional AI-Integrated platform designed for users.

Traffic Light Controller

This traffic light controller uses a memory-based circuit built entirely from NAND gates to manage the light sequence. The D flip-flops act as storage units that remember the current color, while a network of logic gates calculates which light should turn on next. Each pulse of a clock signal pushes the system to the next step in the cycle, ensuring a smooth and repeatable transition from green to yellow to red.

Snake_Water_Game

This Snake Water Gun project is a Python-based recreation of the classic hand game, similar to Rock Paper Scissors. Built primarily with the random module, the program enables a user to compete against a computer that makes unpredictable choices using pseudorandom generation.

Skills:

Skills

Frontend Development

HTML, CSS, JavaScript

Backend Development

python,MongoDB

Tools

Git, GitHub, VS Code

Certifications:

Certifications

Winner Certificate
Semi-Final Round, ICT Olympiad Bangladesh S2

Aspire Leaders Program
Certified Participant

CS Fundamentals
Phitron(Fall 2024)

Full-Funded Scholarships
SSC and HSC

11 Technology Stack:

Frontend Technologies:

→ HTML5

→ CSS3

→ JavaScript (ES6)

→ Font Awesome (External Libraries) → Google Fonts
(Poppins)(External Libraries)

Deployment Platform: GitHub Pages.

Reason:

- Free hosting.No cost for static websites.
- Automatic deployment.Can Push to repository triggers automatic deployment.

12 IMPLEMENTATION:

HTML (HyperText Markup Language):

HTML is used to create the basic structure of the website. It defines different sections such as Home, About, Skills, Projects, Education, Certificates, and Contact. All headings, paragraphs, images, buttons, and forms are created using HTML tags. It acts as the backbone of the website and organizes the content in a proper layout.

Example in project:

HTML is used to create navigation menu, profile section, project cards, and contact form fields.

CSS (Cascading Style Sheets):

CSS is used to design and style the website. It controls the colors, fonts, spacing, layout, and overall appearance of the portfolio. CSS Grid and Flexbox are used to arrange content in columns and rows. Hover effects, background transparency, dark theme, and responsive design are also implemented using CSS to make the website attractive and mobile-friendly.

Example in project:

CSS is used to create card layouts for projects and skills, apply hover animations, and adjust layout for different screen sizes.

JavaScript:

JavaScript is used to add interactivity and dynamic behaviour to the website. It handles actions such as menu button clicks. JavaScript improves user experience by making website more responsive and Interactive.

Example in project:

When a user clicks on navigation buttons, JavaScript scrolls the page to the selected Section and updates the active menu.

13 Testing:

- Navigation testing across all sections-[ok](#)
- Click testing for all interactive elements-[ok](#)
- Form submission testing with different input-[ok](#)

14 Deployment:

Deployment Process:

Version control using Git:

- Initialize a Git repository in the project root.(Sazzad-hossain-portfolio)
- Track changes using commits with clear and meaningful messages.
- Use branches (I used main) for feature development.

Push code to a remote repository (Github).

Basic workflow:

- > git init > git add .
- > git commit -m "Initial commit"
- > git branch -M main
- > git remote add origin

<<https://github.com/SAzzAd-main/Sazzad-Hossain-Portfolio>>

- > git push -u origin main

15 Limitations:

- No Backend Infrastructure
- Static Content Only
- Limited Form Handling
- No User Authentication
- No Database
- SEO Limitations

16 Future Enhancements:

- Blog section.
- Enhanced project showcase.
- Advanced animation.
- Backend integration.
- Admin panel.
- Analytics dashboard.
- Performance optimization.

17 Conclusion:

This project successfully developed a personal portfolio website using HTML, CSS, and JavaScript. The website presents personal details, skills, and projects in a clean and responsive design. Through this project, practical knowledge of frontend development and basic software engineering concepts was gained. Overall, the project helped improve technical skills and understanding of web design.
